

Bitcoin through a progressive lens

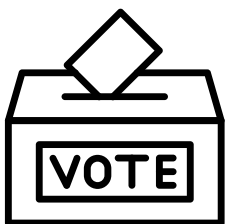

Bitcoin is digital money secured by a decentralized global network of computers. There is no CEO, no company, and no central authority. Bitcoin is permissionless, borderless, censorship resistant and has a verifiably fixed supply.

Bitcoin is not gated by bureaucracy, wealth, or geography. It allows members of global **marginalized communities** to secure their wealth and transact in ways that **can't be censored or confiscated**.

Bitcoin allows one to store wealth independently of institutions and **resist financial censorship**. This is particularly important for people around the world **fighting authoritarian or totalitarian regimes**.

Bitcoin's energy use is transparent and measurable. Bitcoin drives **renewable energy** investment, reduces harmful methane emissions, provides a flexible load for the grid and **creates jobs**.

Bitcoin is **resistant to corporate control** and uses open source software. Bitcoin's **consensus protocol is grassroots** and can be adopted by anyone. Nobody owns the Bitcoin protocol or profits directly from it.
